

V4 - V3's graph + verify grounded in live Wikipedia

5 agents, 5 LLM calls/item - Node 5 checks Node 4's answer, calls Wikipedia only if needed

Node 5 reads the clinical report + case summary straight from state, checks the decider's answer against them, and calls `search_wikipedia` only if the report alone doesn't settle it.

purple = LLM call - teal/cyan = retrieval (no LLM) - amber = long-term memory - dashed = optional node
