

V5 - V3's graph + a verifier that recalls an evolutionary mistake bank

6 agents, up to 6 LLM calls/item - Node 6 is the only node that ever reads gold

Node 5 never sees gold - it only recalls corrective lessons from OTHER cases the system got wrong before.

Node 6 runs after verify, is the only node that reads gold, and writes a lesson only when the final answer is wrong.

purple = LLM call - teal = retrieval (no LLM) - amber = long-term memory - dashed = optional node - red text = reads gold
